

## **Setting up SMTP Credentials and Verifying Email/Domain for Email Sending:**

Step 1: Go to [smtpjs.com](https://smtpjs.com) and select Setup an SMTP server here. It will open [elasticemail.com](https://elasticemail.com).

Step 2: Create an account. If you already have an account, proceed to the next step.

Step 3: Go to settings and select "Create SMTP Credentials."

Step 4: Enter your email and select "Create."

Step 5: Note down your username and password.

Step 6: Go back to [smtpjs.com](https://smtpjs.com) and select "Encrypt your SMTP Credentials."

Step 7: Enter your username and password. If you have a domain, you can enter it, but for now, leave it empty.

Step 8: The website will generate a code. Take note of that code.

Step 9: Go to [app.elasticemail.com](https://app.elasticemail.com) and select "Settings," then choose "Manage Domains."

Step 10: Click on "Start verification."

Step 11: If you have your own domain, select "Verify Domain." If you don't have a domain, choose "Verify Email." Note: If you use your own domain, your emails are less likely to end up in the spam or promotions folder. If you use email services like Gmail, Yahoo, or Hotmail, there is a higher chance of your emails being placed in the spam or promotions folder.

Step 12: If you chose "Verify Email," enter your email address and select "Continue."

Step 13: Open your email and click on the ElasticEmail URL to verify your email.

Step 14: Your email is now verified, and you can use it to send emails to anyone. Note: If you want to send from a different email, please repeat Steps 9 to 14.

Step 15: Now go to our project and click on Change Secure Token and enter the secure token.

Step 16: Now you can use this program to send emails (Verified ones) to any other emails.
